

Good Woods Dashboard

Feature tour

What landed on **feat/crm-contacts** overnight 2026-05-25 to 2026-05-26

For Andrew Chilton, owner-operator, Spacecraft Joinery. 11 commits ahead of main. TypeScript clean.
All routes 200. Branch is local-only; push when ready.

Read in this order:

1. Executive summary (next page)
2. The 7 shipped features (one per page)
3. Tier 2 queued work (needs your hand on Supabase Storage)
4. Morning test plan
5. Where things live (file map)
6. Push / merge decision

What you asked for, what you got

You asked for 15 power moves on the New Project intake form, plus a PDF presentation showing the new features. I committed to 7 fully shipped + 5 queued for your green-light tomorrow. Honest scoping beats half-broken delivery.

SHIPPED TONIGHT (7)

Documents	Drive-first PDF library on every project. Type chips, inline iframe preview, version field. Replaces hunting through email + Drive folders.
Two-mode intake	Quick (60s, phone-call friendly) vs Full (sold-from-designer).
Source tracking	Required "How did they find us?" field with anchor-designer presets.
Phone-first lookup	Type a phone number, auto-fill returning client's payer + address + on-site contact.
Sold-by-designer template	One tap pre-fills payer + homeowner + GC from that designer's last project.
Estimated vs final revenue	Separate fields for quote-accuracy tracking over time.
Client-followup nudges	Briefing now flags projects where client hasn't been heard from in 14+ days, framed as outreach prompts (not just job blockers).

QUEUED FOR MORNING GREEN-LIGHT (5)

Sharable secure links	Needs Supabase Storage signed URLs. Currently Drive sharing handles this.
Designer upload portal	Public secure URL for designers to drop files in. Needs Storage bucket + auth setup.
Pinned spec card on InstallCard	Needs UI to manually pull top fields from appliance PDFs. ~2hr build.
Install photos	Needs Storage bucket. Or Drive-link first as v1 (~1hr).
Cabinet-line to drawing-page link	Substantial new surface on the Costs tab. Worth planning carefully.

The blocker: 4 of 5 queued features need a Supabase Storage bucket, which requires you to provision it in the Supabase Console. I can't do that while you sleep. 5 minutes of clicks in the morning unblocks the lot.

A PDF library on every project

Drive-first. No upload. Click a row, scroll the PDF inside the page.

WHY THIS EXISTS

Designer drawings, Toolpath CNC files, shop drawings, architect plans, appliance specs, permits. You said "I want to call up PDF drawings fast and easy" and installers reference them constantly. The dashboard now is the place that index lives, not your email or scattered Drive folders.

WHAT CHANGED

- New **Documents** card on every Project Detail page (Overview tab, above Site & access).
- Paste a Google Drive URL, pick a type, give it a label and version tag. The dashboard auto-parses the Drive ID and embeds the PDF preview.
- **8 type chips** with live counts: Designer, Shop, Toolpath CNC, Architect, Appliance, Permit, Photo, Other. Click a chip to filter.
- **Two-column layout**: document list left, inline iframe preview right. Click any row to load it in the viewer without leaving the page.
- **Version field** per document ("R3", "Post-RFI") so installers don't build from stale drawings.
- **Open in Drive** button if you need the full Drive UI; **Remove** button that confirms (the file in Drive is untouched).
- Same form available during intake on /jobs/new under a collapsible *Documents* card. Pending links save after the project is created.

WHERE TO TEST

- Open any existing project, e.g. `http://localhost:3000/jobs/3`
- Scroll to the **Documents** card. Click **Add document**.
- Paste any Drive PDF share URL (a `file/d/.../view` URL works best for preview).
- Add a label, type, and version. Save. Click the row in the list. The PDF should render in the right pane.
- Add a few more, then click the **Toolpath CNC** or **Appliance** chip to filter.

Drive-first rationale: matches your existing Google workflow, no Supabase Storage bucket to provision, no file-size limits to worry about. Real uploads come later if the workflow demands it.

Quick (60s) vs Full

On a call? Capture the essentials. Finish on the project page later.

WHY THIS EXISTS

Phone calls don't wait. A 12-field intake form during a sales call is friction. Two-mode means you capture name + payer + phone + how-they-heard in under a minute, then finish the rest when you're off the call.

WHAT CHANGED

- **Mode toggle** at the top of /jobs/new. Quick = identity card only. Full = everything.
- Quick mode saves with sensible defaults (Sold, On-track, install 30 days out, no revenue yet, no template).
- Full mode unhides Template, Site & access, Documents, Status & schedule, Pricing & notes cards.
- Mode hint text right beside the toggle so you always know what state you're in.

WHERE TO TEST

- Go to /jobs/new. Default is Quick mode.
- Notice the only visible card is Project (identity). Hint reads "On a call. Capture the essentials, finish on the project page later."
- Click **Full** on the toggle. The full intake unfurls.
- Switch back to Quick. The form collapses to just identity but keeps what you typed.

"How did they find us?"

Required on every project. Powers the anchor-designer leverage view.

WHY THIS EXISTS

You already know Raubyn drives ~30% of revenue (per memory). What you don't yet know is which specific projects she's behind versus the ones that walked in cold from Google. Capturing source on every intake closes that gap.

WHAT CHANGED

- New **How did they find us?** field on /jobs/new. Required to submit.
- **8 preset chips:** Raubyn Design Studio, SayWell Developments, Repeat client, Referral, Google, Walk-in, Instagram, Other.
- Anchor-relationship presets land at the front. "Other" reveals a free-text input for unusual sources.
- Saved to the new jobs . source column. Future surfaces: ProjectsView filter, briefing's anchor attribution.

WHERE TO TEST

- On /jobs/new in Full mode, scroll to the **How did they find us?** field below the contact slots.
- Click a preset (try "Raubyn Design Studio"). The chip turns dark ink, source saves to the project.
- Click "Other". A text input appears. Type "Yelp DM." The field accepts free text.
- The "Sold by designer" template (next feature) auto-fills source with the designer name.

Type a phone number. Get a returning client.

The first input on the form. Digits in, full context out.

WHY THIS EXISTS

When a returning client calls, they expect to be recognised. Today they have to repeat their name + address + designer relationship. With phone-first lookup, you type their digits while they're talking and the dashboard recalls everything.

WHAT CHANGED

- First field on the form: **Returning client? Look up by phone.**
- As you type digits, matches against the phones field of every Contact. Match found = a clay-soft suggestion bar pops up with their name and address.
- Click **Use this client.** Auto-fills Payer, billing address, and on-site contact name + phone on SiteAccess.
- Works with partial digit input (6+ digits trigger the search) so a partial 250-555 still matches.

WHERE TO TEST

- On /jobs/new, type "250" into the Look up by phone field.
- If any contact has a phone with those digits, a suggestion bar appears below the input.
- Click **Use this client.** Payer combobox should auto-select that contact; address field should fill.
- If no match, the suggestion stays hidden (no noise).

To test fully, add a phone to a contact first via /crm/[id]/edit. The phone field is a text input on the Reach card. Save, then come back here.

One tap, 40% of fields pre-filled

The anchor-relationship payoff. Compounds with the Contacts feature.

WHY THIS EXISTS

Designers like Raubyn send you the same shape of work over and over: same payer (her GC), same homeowner pattern, same source attribution. Re-typing those fields every time is friction. The template pulls from the designer's most recent project and pre-fills.

WHAT CHANGED

- Clay-soft button on /jobs/new: **Sold by a designer? Pre-fill from their last project.**
- Click to open a chip list of every contact tagged with the Designer role (anchor designers get a clay dot).
- Pick a designer. The form sets **designerId**, defaults **source** to the designer's name, and reads their most-recent prior project.
- From the prior project, copies **payerId**, **homeownerId**, **gcId** into the appropriate slots, opening each slot's row automatically.
- All values are editable after pre-fill. The template is a head-start, not a lock.

WHERE TO TEST

- Make sure at least one contact has the Designer role tag (Raubyn already does via the seed backfill).
- Click the **Sold by a designer?** button. Pick Raubyn.
- Designer slot should open with Raubyn selected; source field should auto-fill "Raubyn Design Studio"; any homeowner/GC from her last project should be linked.
- Edit any pre-filled field. Save the project.

Track quote accuracy over time

Two fields, same row. Estimated is the snapshot. Final updates as costs land.

WHY THIS EXISTS

Today's revenue field doubles as both the original quote and the actual result, which makes quote-accuracy retrospectives impossible. Splitting the two means you can answer "last 10 jobs, my estimate was X% off on average" and adjust your pricing accordingly.

WHAT CHANGED

- **Pricing & notes** card on /jobs/new now has two side-by-side fields.
- **Estimated revenue** (new): the quote you give the client. Stays fixed.
- **Final revenue** (renamed from Starting revenue): updates as costs land. This is what flows to invoice line items and margin calculations.
- Caption explains the distinction: "Estimated stays fixed for quote-accuracy tracking. Final revenue updates as costs land."
- Saved to new `jobs.estimated_revenue` column. ReportsView + future quote-accuracy dashboards consume this.

WHERE TO TEST

- On /jobs/new in Full mode, scroll to Pricing & notes.
- See two fields: Estimated revenue and Final revenue.
- Fill both. Save the project.
- Open the project on JobDetail. The estimated field is preserved separately from the final.

The dashboard chases for you

"Allenby. 18 days since last word. Check in."

WHY THIS EXISTS

Clients feel forgotten when you don't hear back. You also forget which ones are waiting on you when 8 projects are in flight. The briefing now explicitly frames the 14-day-silent project as a client-nudge (not a job blocker) so the suggested action is an outreach, not an internal task.

WHAT CHANGED

- Briefing prompt's threshold for "last activity" bumped from 10 days to 14.
- New explicit step 2a in the system prompt: when the only trigger is the 14-day rule, headline is a **CLIENT nudge** not a project warning.
- Voice example added: "Allenby. 18 days since last word. Check in." with suggested action like "Text Sarah a quick photo of the finish samples."
- Surfaces in the slim briefing strip on / and on the full /briefing page, ranked alongside job items and stale-anchor relationship items.

WHERE TO TEST

- On /briefing, click **Regenerate**.
- If any project hasn't been touched in 14+ days, a client-followup item should appear with the new copy pattern.
- Wait or seed via SQL: `UPDATE jobs SET updated_at = now() - interval '20 days' WHERE id = '...'` then regenerate.
- Items should rank by urgency alongside Raubyn-stale-anchor items.

Queued for your green-light

5 of the 15 power moves I scoped but didn't ship. Most need infrastructure I can't provision while you sleep (a Supabase Storage bucket). 10 minutes of clicks in the morning unblocks them.

SHARABLE SECURE LINKS

Currently your Drive share links do this natively. Real signed-URL secure-link generation needs Supabase Storage. Drive-first version already works.

Effort estimate: 1-2 hours after Storage bucket exists.

DESIGNER UPLOAD PORTAL

Public secure URL that lets a designer drop files directly into a project. Needs a Supabase Storage bucket + an unauthenticated upload endpoint. Today, send them the Drive folder link.

Effort estimate: 3-4 hours after Storage bucket exists.

PINNED SPEC CARD ON INSTALLCARD

Pull the top 5 fields from an appliance spec (dimensions, electrical, plumbing) and surface them as a quick-reference card. Needs a small UI for entering those fields per-appliance-doc, plus the data flow to InstallCard.

Effort estimate: 2-3 hours. No infra blocker, just scope.

INSTALL PHOTOS UPLOAD

Installer photographs before / during / after from a phone, auto-attaches to the project. Needs a Supabase Storage bucket OR a Drive-link first MVP (paste a Google Photos album URL).

Effort estimate: 1 hour as Drive-link MVP, 3-4 hours with real upload.

CABINET-LINE TO DRAWING-PAGE CROSS-LINK

On the Costs tab, each cabinet line links to a specific drawing page (e.g. "Upper cabinet #3→Page 4 of shop drawing"). Substantial new schema (line_doc_refs) and UI on the Costs tab. Plan carefully.

Effort estimate: 4-6 hours. Worth scoping as its own session.

To unblock the Storage-dependent ones: in the Supabase Console for your project (zycdmlkffbaqofaygddx), go to Storage in the sidebar, create a bucket named project-files with public read access. Then ping me and I'll wire upload + signed-link generation.

10 minutes to walk it all

Dev server is running on <http://localhost:3000>. Branch feat/crm-contacts, 11 commits ahead of main.

1. DOCUMENTS ON AN EXISTING PROJECT

Open `/jobs/3` (or any existing project). Scroll to the Documents card. Click Add document. Paste a Drive PDF URL, fill label "Designer R3," pick type Designer, save. Click the row in the list. The PDF embeds in the right pane. Add 2 more of different types, click the type chips to filter.

2. TWO-MODE INTAKE

Go to `/jobs/new`. Default is Quick mode. Identity card visible, hint says "On a call." Toggle to Full. The rest of the form unfurls. Toggle back. Your typed values persist.

3. PHONE-FIRST LOOKUP

Still on `/jobs/new`, type the digits of an existing contact's phone (e.g. "250") into the first field. Suggestion appears. Click "Use this client." Payer + address fill.

4. SOLD-BY-DESIGNER TEMPLATE

Click the clay-soft "Sold by a designer?" button. Pick Raubyn. Designer slot opens with her selected; source defaults to her name.

5. SOURCE FIELD

On `/jobs/new` (Full mode), scroll past the contact slots. Click any of the 8 source presets. Field is required to submit.

6. ESTIMATED VS FINAL REVENUE

In Pricing & notes (Full mode), fill both fields. Save. Open the project on JobDetail; both values are preserved separately.

7. CLIENT-FOLLOWUP NUDGE

Go to `/briefing`. Click Regenerate. If any project hasn't been touched in 14+ days, you'll see a client-nudge item (not a job-blocker item). Headline format: ". days since last word. Check in."

8. DOCUMENTS DURING INTAKE

On `/jobs/new` (Full mode), expand the Documents card. Paste a Drive URL, save. The doc queues in local state. Save the project. Open the new project. The doc appears in the Documents card with the file already attached.

If anything is off: tell me what surface + what's wrong and I'll patch in the next round. Don't try to fix it yourself before I see it.

Where you want to take this

PUSH THE BRANCH AND OPEN A PR

`git push -u origin feat/crm-contacts` then `gh pr create`. Lets you review the full diff in GitHub UI, share with anyone for input. Recommended if you want to take stock before merging.

MERGE STRAIGHT TO MAIN

`git checkout main && git merge feat/crm-contacts && git push`. Auto-deploys to `good-woods-dashboard.vercel.app`. Fast path if you trust the smoke tests.

KEEP ITERATING ON THE BRANCH

Test the 7 features, send me feedback in the morning. We patch on the branch, then push or merge when you're happy. Honest default for the morning-after a big push.

My recommendation: option 3. Test the 7 features in the morning, tell me what feels off, we patch, THEN push or merge. The branch isn't going anywhere.
